

## Nickel Alloy Technical Datasheet

# MP35N Plate, Bar, Coil, and Tube

## UNS R30035 / Specialty & High-Performance Alloys

MP35N is a nickel-cobalt-chromium-molybdenum alloy known for high strength, corrosion resistance, and fatigue performance.

<b>Grade</b>	MP35N
<b>UNS / reference</b>	UNS R30035
<b>Alloy family</b>	Specialty & High-Performance Alloys
<b>Available forms</b>	plate, bar, coil, tube
<b>Primary use</b>	RFQ preparation, grade comparison, product-form selection, certificate planning
<b>Revision</b>	2026-06-11

## General Description

This document presents MP35N in a concise technical format for nickel alloy raw material buyers. It follows the style of established alloy data bulletins: grade identity first, followed by standards, composition review, supply forms, engineering reference tables, fabrication notes, and RFQ checkpoints.

- High strength with excellent corrosion resistance
- Good fatigue and stress-corrosion performance
- Requires careful condition and cold work confirmation

## Standards and Specification References

Common references include AMS 5844, AMS 5845, AMS 5846, and customer specifications for bar, strip, plate, or tube where applicable.

Final chemistry, mechanical values, heat treatment, testing, and acceptance criteria must be confirmed against the active standard, mill certificate, and customer specification.

## Composition and Product Forms

# Chemical Review and Supply Matrix

## Principal Alloying Elements

Element	Level / role	Procurement meaning
Ni / Fe / Co	Base system	Grade family matrix
Cr / Mo	Corrosion / heat support	Environment-dependent resistance
Ti / Al / Nb	Strengthening where specified	Age-hardening or stability additions
C, Mn, Si	Controlled minor	Processing and standards control
S, P	Low residuals	Confirmed by applicable specification

## Raw Material Form Matrix

Form	RFQ dimensions	Grade-specific review note
Plate	Thickness, width, length, surface, flatness, tolerance, piece quantity	MP35N plate and sheet inquiries are checked by thickness, surface, tolerance, and heat treatment condition.
Bar	Diameter/section, length, straightness, condition, bundle quantity	MP35N bar inquiries are checked by diameter or section size, delivery condition, and test certificate scope.
Coil	Thickness, width, edge, coil ID, coil weight, surface finish	MP35N coil and strip inquiries are checked by width, thickness, edge, coil ID, and surface finish.
Tube	OD, wall thickness, length, route, end condition, NDE/test scope	MP35N tube inquiries are checked by OD, wall thickness, length, standard, and test requirements.

## Documents to Confirm

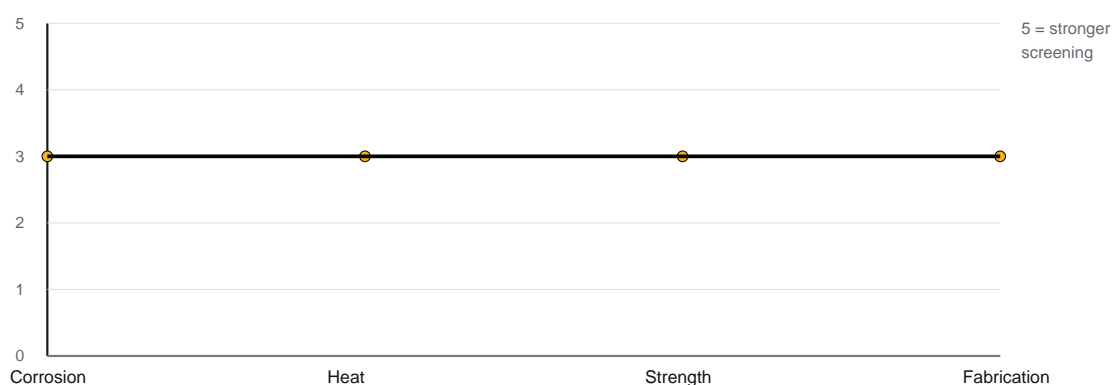

Item	Typical record
MTC	EN 10204 3.1 / mill certificate when required
Traceability	Heat number, lot, size, product form, quantity, condition
Dimensional report	Thickness, OD/WT, diameter, width, length, tolerance as applicable
Additional tests	PMI, NDE, hydro, hardness, corrosion test, third-party inspection when specified

## Engineering Reference

# Properties, Temperature, and Screening Notes

## Relative Property Profile

Figure 1 - Relative property profile for RFQ screening

Relative guide only; do not use as design allowable data.

## Modulus / Elevated Temperature Data Format

The table below shows the recommended format for reviewing modulus and temperature-dependent data. Use certified grade-specific data from standards, producer bulletins, or project specifications for design calculations.

Temp	Tension modulus	Shear modulus	Poisson ratio	Use note
Room	High / grade dependent	High / grade dependent	Verify	Baseline for procurement screening
Moderate	Reduced vs. room temp	Reduced vs. room temp	Verify	Check code allowables and condition
Elevated	Further reduction	Further reduction	Verify	Use design standard, not this guide

## Room-Temperature Mechanical Data Review

Data item	How it should be handled
Tensile strength	Confirm by form, size, condition, and applicable ASTM/ASME/EN/AMS standard
Yield strength	Confirm 0.2% offset or specified method in the purchase standard
Elongation	Confirm gauge length, test direction, and product form
Hardness	Use only when required by standard, order, or project inspection plan

## Fabrication and Corrosion Review

# Fabrication Notes and Service Screening

## Welding / Joint Preparation

Figure 2 - Typical weld preparation review points

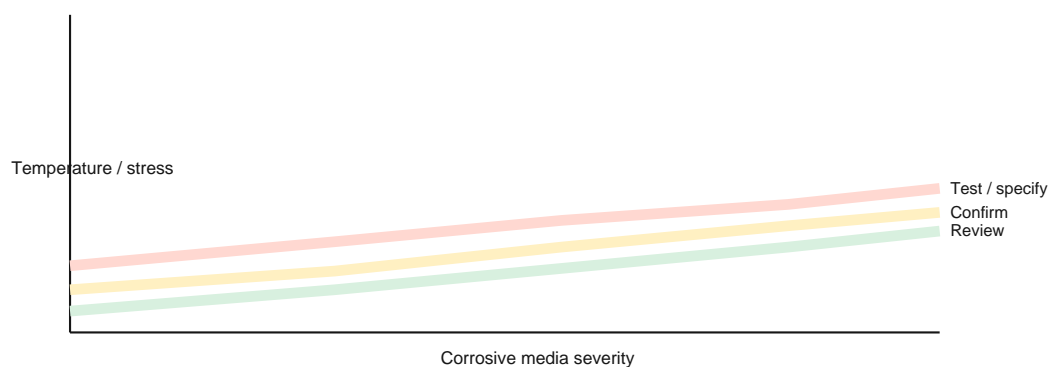

Joint design must follow qualified WPS/PQR, applicable code, and customer specification.

## Fabrication Notes

- Cleanliness, filler metal selection, heat input, interpass temperature, and post-weld requirements must be controlled by qualified procedure.
- Cold work, solution treatment, annealing, or age-hardening response depends on the exact alloy grade and product form.
- For plate, bar, coil, and tube RFQs, include surface condition, tolerance, straightness or flatness, and inspection scope.

## Corrosion Selection Map

Figure 3 - Corrosion service screening map

Use corrosion testing, published alloy data, and project media details for final selection.

## Applications and RFQ Checklist

# MP35N Application Review

## Common Application Areas

Application area	Typical material question
Aerospace and energy components stock	Confirm grade, product form, standard, condition, dimensions, and document package.
Medical and high-reliability materials	Confirm grade, product form, standard, condition, dimensions, and document package.
Downhole service bar	Confirm grade, product form, standard, condition, dimensions, and document package.
Corrosion-resistant spring material	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.

## RFQ Checklist

Step	RFQ field	Required detail
1	Alloy grade	MP35N plus UNS / ASTM / EN / AMS reference if available
2	Product form	Plate, bar, coil, tube, or another published product form
3	Dimensions	Thickness, width, length, diameter, OD, wall thickness, edge, tolerance
4	Condition	Annealed, solution treated, aged, cold worked, pickled, polished, or project-specific
5	Quantity and logistics	Pieces, weight, delivery term, destination, packaging, project schedule
6	Documents	MTC, inspection scope, third-party inspection, and customer specification

## Use Limitation

This datasheet is a sourcing and quotation aid. It is not a controlled design standard and does not replace producer data, engineering code requirements, customer specifications, or mill-issued certificates.
