

Nickel Alloy Technical Datasheet

Nickel 200 Plate, Bar, Coil, and Tube

UNS N02200 / Commercially Pure Nickel

Nickel 200 is a commercially pure nickel grade valued for ductility, caustic corrosion resistance, and strong thermal and electrical conductivity.

Grade	Nickel 200
UNS / reference	UNS N02200
Alloy family	Commercially Pure Nickel
Available forms	plate, bar, coil, tube
Primary use	RFQ preparation, grade comparison, product-form selection, certificate planning
Revision	2026-06-11

General Description

This document presents Nickel 200 in a concise technical format for nickel alloy raw material buyers. It follows the style of established alloy data bulletins: grade identity first, followed by standards, composition review, supply forms, engineering reference tables, fabrication notes, and RFQ checkpoints.

- Excellent resistance to many alkaline environments
- High ductility and good mechanical workability
- Useful conductivity for electrical and thermal applications

Standards and Specification References

Common references include ASTM B160, ASTM B161, ASTM B162, ASME SB equivalents, and project-specific sheet, bar, and tube specifications.

Final chemistry, mechanical values, heat treatment, testing, and acceptance criteria must be confirmed against the active standard, mill certificate, and customer specification.

Composition and Product Forms

Chemical Review and Supply Matrix

Principal Alloying Elements

Element	Level / role	Procurement meaning
Ni / Fe / Co	Base system	Grade family matrix
Cr / Mo	Corrosion / heat support	Environment-dependent resistance
Ti / Al / Nb	Strengthening where specified	Age-hardening or stability additions
C, Mn, Si	Controlled minor	Processing and standards control
S, P	Low residuals	Confirmed by applicable specification

Raw Material Form Matrix

Form	RFQ dimensions	Grade-specific review note
Plate	Thickness, width, length, surface, flatness, tolerance, piece quantity	Nickel 200 plate and sheet inquiries are checked by thickness, surface, tolerance, and heat treatment condition.
Bar	Diameter/section, length, straightness, condition, bundle quantity	Nickel 200 bar inquiries are checked by diameter or section size, delivery condition, and test certificate scope.
Coil	Thickness, width, edge, coil ID, coil weight, surface finish	Nickel 200 coil and strip inquiries are checked by width, thickness, edge, coil ID, and surface finish.
Tube	OD, wall thickness, length, route, end condition, NDE/test scope	Nickel 200 tube inquiries are checked by OD, wall thickness, length, standard, and test requirements.

Documents to Confirm

Item	Typical record
MTC	EN 10204 3.1 / mill certificate when required
Traceability	Heat number, lot, size, product form, quantity, condition
Dimensional report	Thickness, OD/WT, diameter, width, length, tolerance as applicable
Additional tests	PMI, NDE, hydro, hardness, corrosion test, third-party inspection when specified

Engineering Reference

Properties, Temperature, and Screening Notes

Relative Property Profile

Figure 1 - Relative property profile for RFQ screening

Relative guide only; do not use as design allowable data.

Modulus / Elevated Temperature Data Format

The table below shows the recommended format for reviewing modulus and temperature-dependent data. Use certified grade-specific data from standards, producer bulletins, or project specifications for design calculations.

Temp	Tension modulus	Shear modulus	Poisson ratio	Use note
Room	High / grade dependent	High / grade dependent	Verify	Baseline for procurement screening
Moderate	Reduced vs. room temp	Reduced vs. room temp	Verify	Check code allowables and condition
Elevated	Further reduction	Further reduction	Verify	Use design standard, not this guide

Room-Temperature Mechanical Data Review

Data item	How it should be handled
Tensile strength	Confirm by form, size, condition, and applicable ASTM/ASME/EN/AMS standard
Yield strength	Confirm 0.2% offset or specified method in the purchase standard
Elongation	Confirm gauge length, test direction, and product form
Hardness	Use only when required by standard, order, or project inspection plan

Fabrication and Corrosion Review

Fabrication Notes and Service Screening

Welding / Joint Preparation

Figure 2 - Typical weld preparation review points

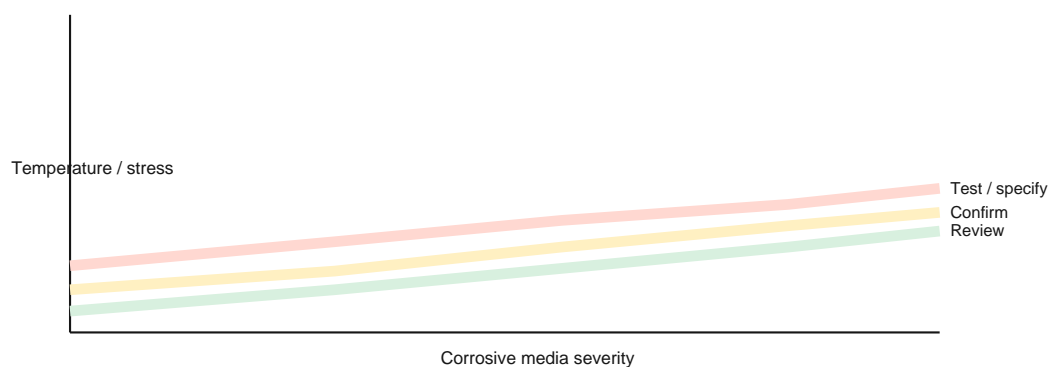

Joint design must follow qualified WPS/PQR, applicable code, and customer specification.

Fabrication Notes

- Cleanliness, filler metal selection, heat input, interpass temperature, and post-weld requirements must be controlled by qualified procedure.
- Cold work, solution treatment, annealing, or age-hardening response depends on the exact alloy grade and product form.
- For plate, bar, coil, and tube RFQs, include surface condition, tolerance, straightness or flatness, and inspection scope.

Corrosion Selection Map

Figure 3 - Corrosion service screening map

Use corrosion testing, published alloy data, and project media details for final selection.

Applications and RFQ Checklist

Nickel 200 Application Review

Common Application Areas

Application area	Typical material question
Caustic handling equipment	Confirm grade, product form, standard, condition, dimensions, and document package.
Chemical processing tanks and linings	Confirm grade, product form, standard, condition, dimensions, and document package.
Heat exchanger components	Confirm grade, product form, standard, condition, dimensions, and document package.
Electrical and electronic materials	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.
Project-specific raw material procurement	Confirm grade, product form, standard, condition, dimensions, and document package.

RFQ Checklist

Step	RFQ field	Required detail
1	Alloy grade	Nickel 200 plus UNS / ASTM / EN / AMS reference if available
2	Product form	Plate, bar, coil, tube, or another published product form
3	Dimensions	Thickness, width, length, diameter, OD, wall thickness, edge, tolerance
4	Condition	Annealed, solution treated, aged, cold worked, pickled, polished, or project-specific
5	Quantity and logistics	Pieces, weight, delivery term, destination, packaging, project schedule
6	Documents	MTC, inspection scope, third-party inspection, and customer specification

Use Limitation

This datasheet is a sourcing and quotation aid. It is not a controlled design standard and does not replace producer data, engineering code requirements, customer specifications, or mill-issued certificates.
